## 1. Introduction

The guideline for EDIFACT-Subsets includes the following sections:

- Graphical depiction of the message structure
- Overview used segments / segmentgroups and their frequency
- Explanation of the used segments and data elements
- Examples

The two diagrams of the graphical depiction and the graphical presentation include the segments and segmentgroups which form part of the subset.

For every segment and group the frequency and the status (M - Mandatory, C - Conditional) is stated, as agreed upon in message INVOIC as defined in directory 99B.

How often a segment occurs in the subset is described in the segment and element-definition.

In „Explanation of used segments and dataelements“ each segment with its elements is explained and displayed in an example.

The first column in the table "data element-no" lists the composite data elements-identification (Cnnn) or the data element-no (nnnn) according ISO-standard.

The second column shows the EDIFACT-description.

The third and forth column "Status" and "Format" show status and format of the elements. Status is encoded "M" for mandatory and "C" for conditional fields.

---

---

## Segment

- A segment is an information-unit which is embedded in the message.
- A segment is the aggregation of logically connected data elements or composite data elements.
- Segments are always placed within a message according to the sequence defined in the branching diagramm.
- A segment starts with a segment-tag (e.g. DTM) that identifies each segment and ends with an segment terminator (e.g. ').
- There are user data segments (e.g. DTM) and service segments (e.g. UNH, UNT).

## Data elements

A data element is the smallest information unit in a segment. Two or more data elements can be combined in an composite data element. These data elements are called component data elements.

- Data elements, composite data elements and data elements within composite data elements are placed within a segment in a fixed sequence. They can be identified according to their position.
- Data elements and composite data elements can have the following status:
  - mandatory or
  - conditional

The presentation of the data format is based upon UNTDED (United Nations Trade Data Element Directory).

## Examples of data formats:

a2	2 alphabetic characters, fixed length
n7	7 numeric characters, fixed length
an4	4 alphanumeric characters, fixed length
a..6	6 alphabetic characters, variable length
n..5	5 numeric characters, variable length
an..60	60 alphanumeric characters, variable length

(ISO-Standards ISO 7372 und ISO 9735).

Delimiters used in the UNA-segment separate segments, component data elements, data elements and composite data elements.

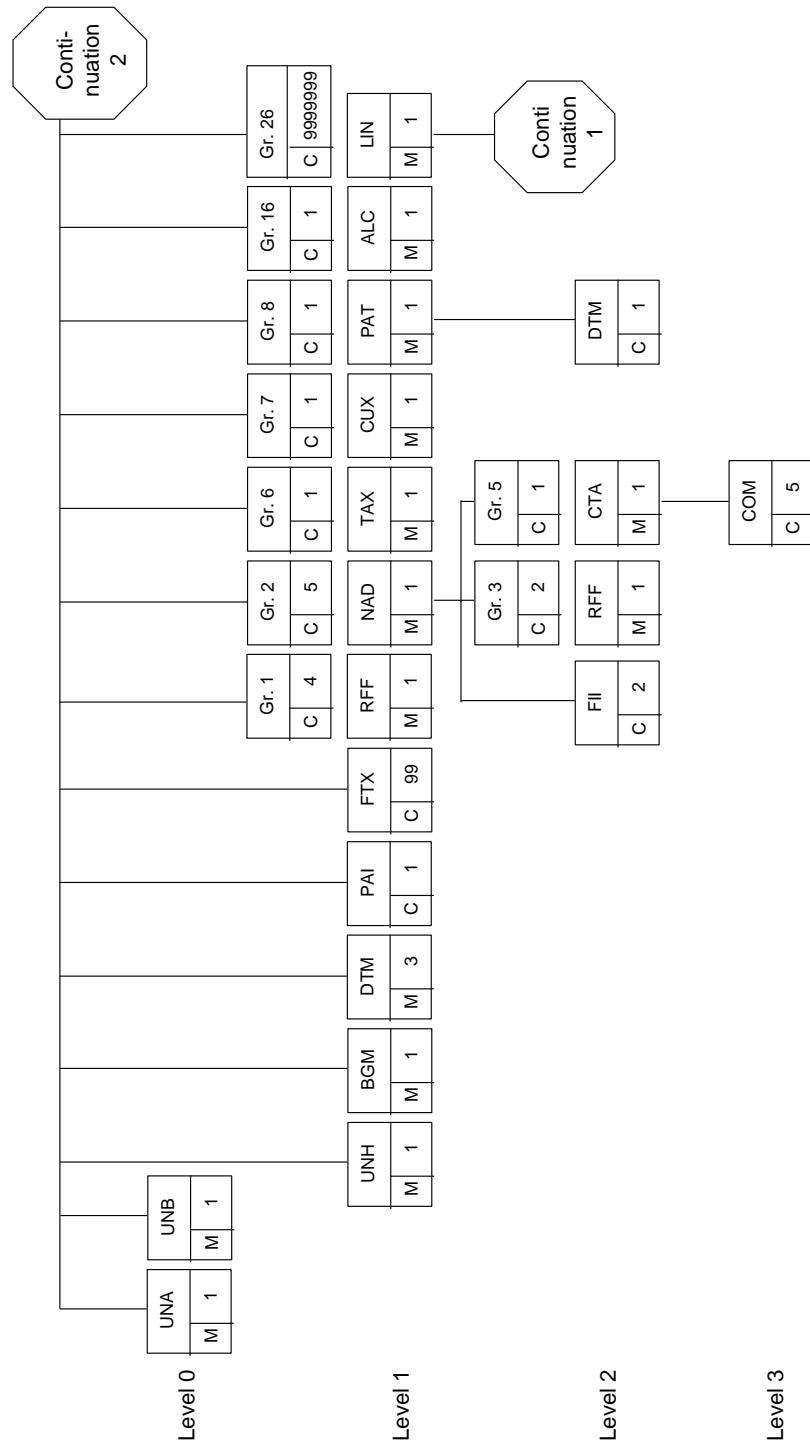

---

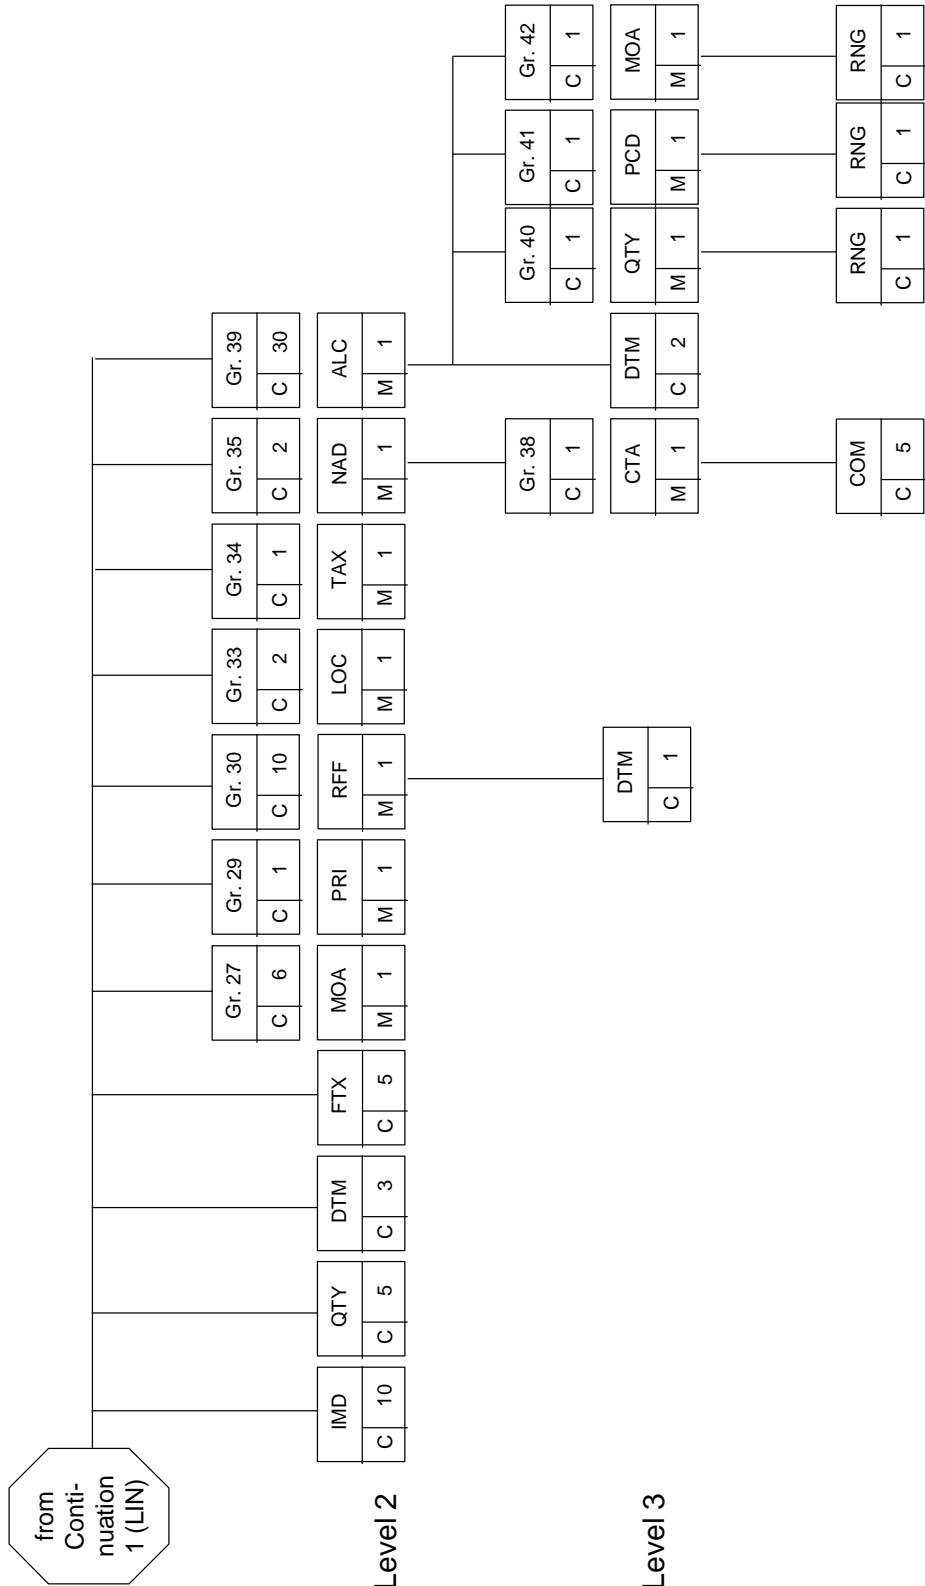

---

The fifth column „description/valid codes“ includes the used qualifiers or a verbal description of the use of this data element. If there are no entries in this column, the data element is not used in this subset.

The diagrams describe both the electronic invoice and the electronic itemised bill in EDIFACT.
